Python offers modules such as scipy, numpy, and pandas for data analysis. And I am going to use these as alternative to R. To get started, I recommend installing the Python IDE, Spyder. If you haven't yet installed python in your computer, don't worry as this will automatically be installed as well.

- Open **Ubuntu Software Center**;
- search for **Spyder**; and,
- click **Install**.

Once successfully installed, open it and try running some arithmetic on the console. Or try the script window and press F5 to execute.
